INSTALLATION

UNCRATING OF MACHINE

1. The complete machine comes in one crate. After the crate is removed, inspect for concealed damage. Remove the bottom skid by removing all bolts. Then cut all wires holding support packing from refrigerant line. Be sure the compressor is snug on rubber mounts. Then check all refrigerant lines for rubbing or touching other surfaces. Also check for possible transportation damage.
2. Remove all service doors and panels.
3. Remove leg package in compartment base and install 4 legs in unit base sockets. Level unit with adjustable legs.
4. Remove protective shipping tape from bin door, freezer curtain.
5. Remove water strainer from storage package for installation in water supply line feeding unit.
6. Open electrical control box and prepare for hook up, use knock outs, cord connectors, etc. Then check unit name plate voltage against building source voltage and make sure they correspond. Caution - improper voltage supplied to units will void your warranty protection.
7. Make sure suction service valve on the condensing unit is fully back seated. Replace the valve cap after checking. All models are shipped with valve back seated. Not necessary on units equipped with Schrader Valves.
8. Make sure that the flow of air is not impeded in any way over condenser on air-cooled models. Keep condenser clean. (Check and clean the condenser monthly.)
9. Operating room temperatures are minimum 50° F. and maximum 100° F.
10. Have the installation and warranty cards been filled out sent to the factory to insure warranty protection?

LOCATION OF THE ICE CUBE MACHINE

UNDER BAR INSTALLATIONS - Locate, if possible, so left end panel is accessible. Locate unit so proper circulation can be attained around the unit and behind it at least four inches. Provide plumbing and electrical connections so the unit can be moved out where the entire top hood can be removed and the unit can still be operated.

KITCHEN INSTALLATION - As a rule, the kitchen is not the most practical place to install an air-cooled condensing unit, as grease is almost always present and makes cleaning of the condensing unit difficult. Do not locate near range or steam table or other heating devices that may be used in the kitchen.

STOREROOM INSTALLATIONS - Be sure storeroom is of adequate size and properly ventilated. A small, poorly ventilated room will greatly impair the efficiency of the unit. The storeroom must be kept above 50 degrees in the winter months.

BASEMENT INSTALLATIONS - Locate machine in the coolest place. Locate the machine in a dry place. Keep away from furnace and boiler room. Keep away from service chutes and runways, also coal or other dust of any kind. If the machine is set over a floor drain, block the machine up enough to eliminate any possible damage to the machine.

LOCATE THE MACHINE SO IT CAN BE SERVICED WHEN NECESAARY. ALLOW AT LEAST FOUR INCHES OF SPACE AROUND THE MACHINE FOR CIRCULATING AIR.

IMPORTANT: ADJUST LEVELER LEGS. MACHINE MUST BE LEVEL.

INSTALLATION

WATER SUPPLY AND DRAIN CONNECTIONS

WATER SUPPLY

The recommended water supply line is 3/8" OD copper tubing. Connect to a cold water supply line with regular plumbing fittings with a shut-off valve installed in an accessible place between supply line and machine. The water strainer supplied with the unit should be mounted with clean-out plug down. Locate the strainer next to the machine and the arrow in the direction of the flow, as per Page 11. A 3/8" male flare connection on left corner post provides easy access.

The water supply should be installed to conform with local code.

DRAIN

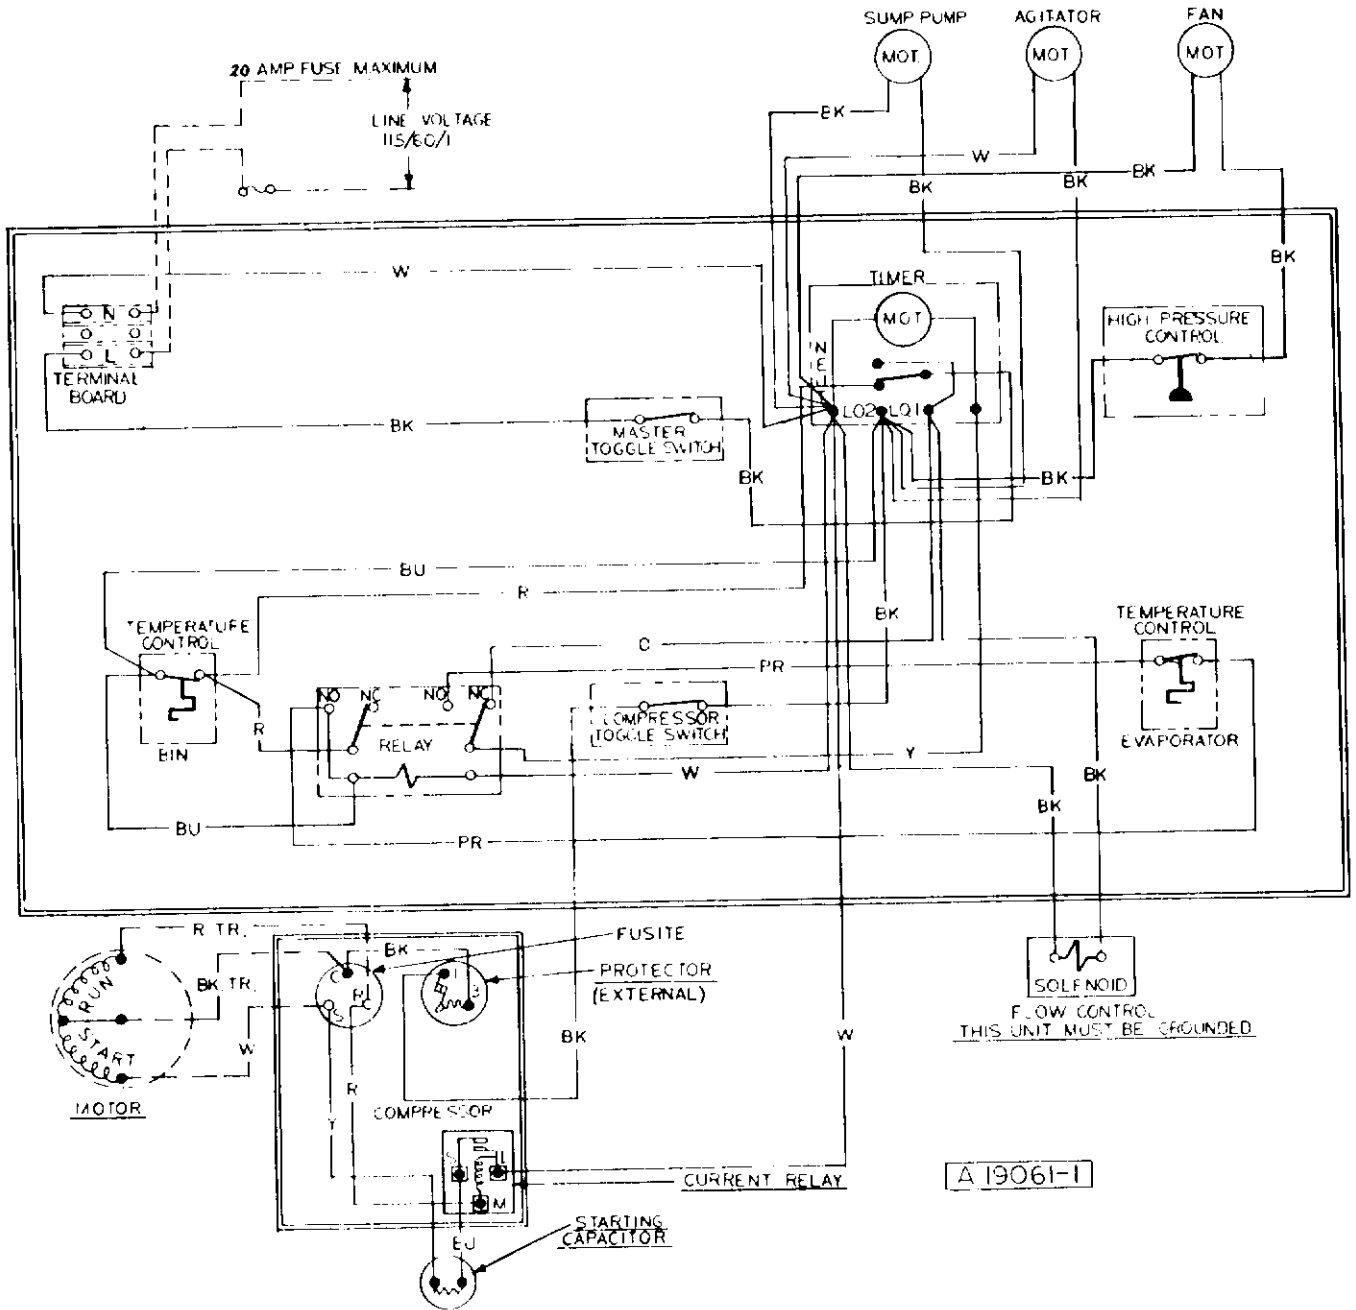

The recommended drain; is 5/8" OD copper tubing. Sweat to drain connection (See Page 11). Must be run to open or trapped drain. If drain is a long run, allow a 1/4" pitch per foot. Drain must be installed to conform with local code.

ELECTRICAL CONNECTIONS AND CHARACTERISTICS

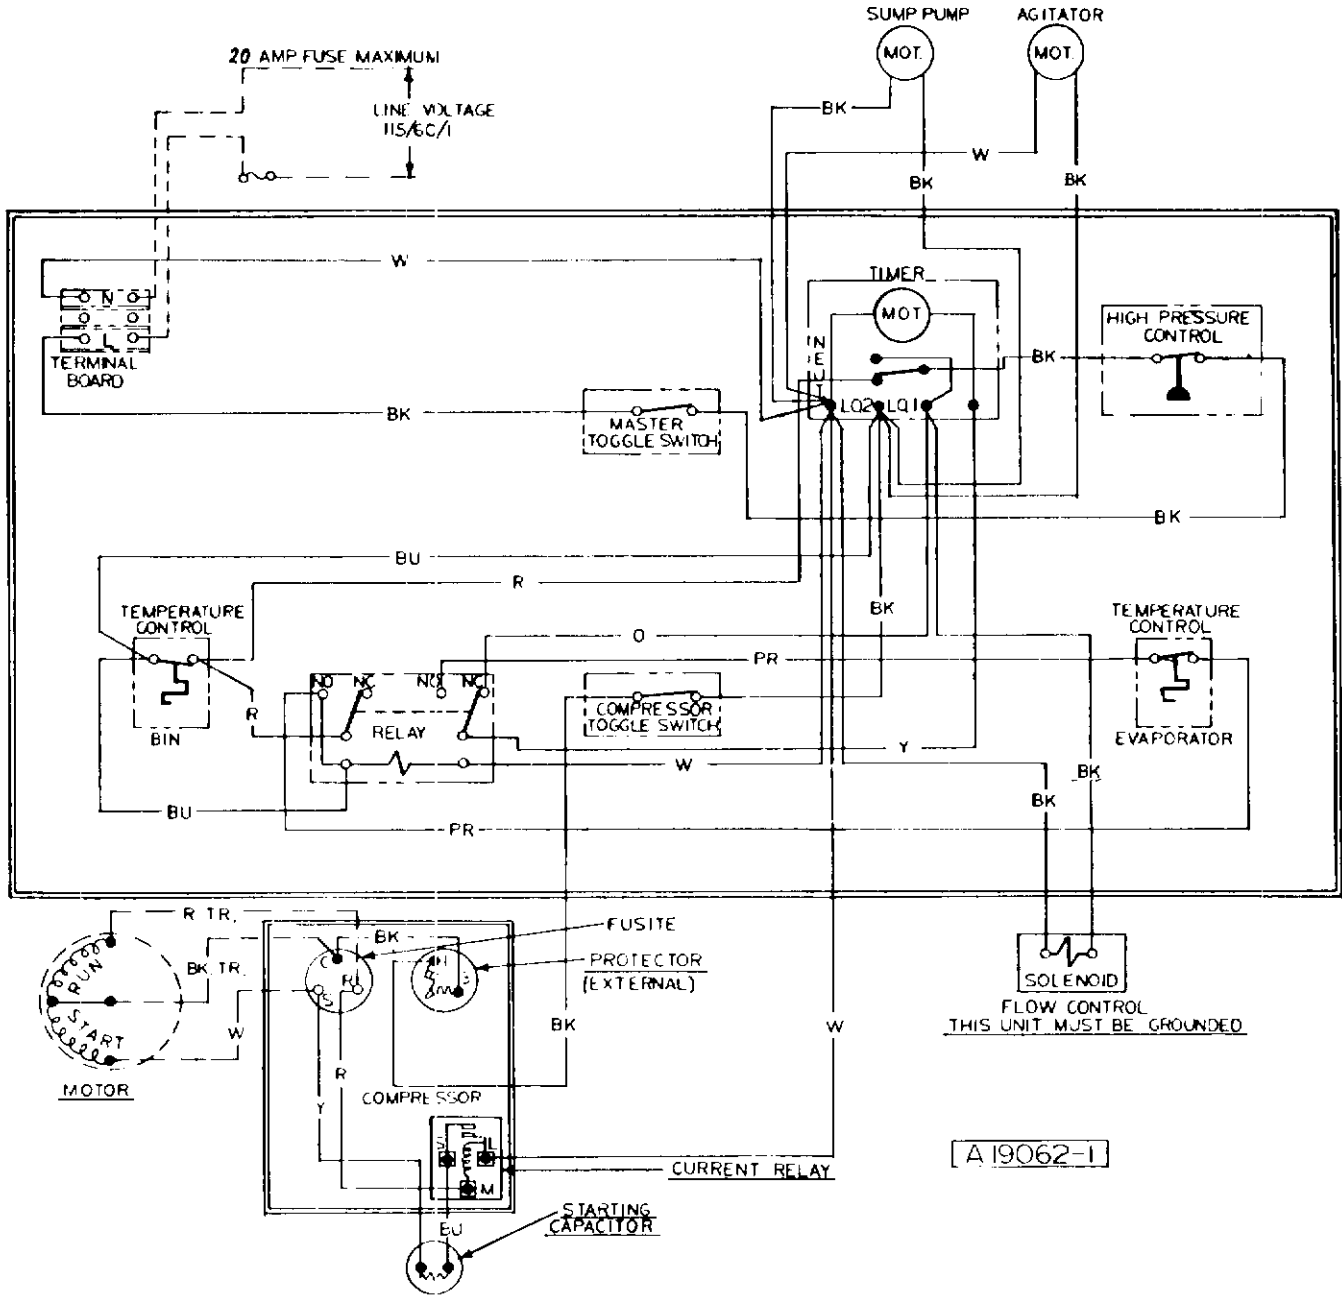

MM110	110-115 V, 60 Cycle	Single Phase, 13 Amps.
-------	---------------------	------------------------

All external wiring should conform with National and local code requirements. Check the voltage on the line before connecting the machine. Model MM110 requires 110-115 volts, 60 cycle, single phase.

The MM110 should be wired to a 20 Amp. circuit. Be certain that the Super Cubers are on their own circuit and individually fused. The maximum allowable voltage variation should not exceed 10% of the nameplate rating even under starting conditions. Low voltage can cause erratic operation, and may be responsible for serious damage to the overload switches and motor windings.

Air Cooled

Title: Wiring Diagram
MM110WJ-1
115-60-1
Water Cooled

INSTALLATION PRACTICE

Open Trapped or Vented
Drain. Recommend 1/4 inch Fall
per foot of run on drain lines.

FINAL CHECK LIST

1. Is the unit level? (IMPORTANT)
2. Have all electrical and piping connections been made?
3. Has the voltage been tested and checked against the nameplate rating?
4. Have the compressor hold-down bolts been checked to insure the compressor is snug to its mounting pads?
5. Is the water supply valve open and the electric power properly hooked up?
6. All masking tape removed from doors, panels and inner freezer curtain?
7. Is the unit clean? Has storage bin been wiped clean with cold water cloth?
8. Has the owner been given the operating manual, and has he been instructed on how to operate the machine?
9. Have the installation and warranty cards been filled out? Check for correct model and serial numbers from serial plate on unit then promptly mail card to factory.
10. Check all refrigerant and conduit lines to guard against vibrations and possible failure.
11. Is there 4" clearance behind and around unit for proper air circulation?
12. Is unit in a room where ambient temperatures are minimum 50° F. even in winter months?
13. Has water supply pressure been checked to insure at least a minimum pressure of 20 pounds?

INSTALLATION - START UP

1. Remove lower front, and left side service doors to facilitate start up and check out.
2. Make sure water supply is turned on, then check timer finishing clock in main control box making sure the micro switch arm is resting down in offset slot in the cam (harvest position). If adjustment is necessary, turn timer knob clockwise into harvest position.
3. Inspect components in electrical control box, check for loose or frayed wire, then turn both manual switches to "on" position. All cubers have two manual on-off switches. One is for motor compressor only during cleaning operation, one is master switch for complete unit.
4. When both switches are thrown "on", water inlet solenoid will be energized allowing water to enter cuber, thru warm water tank, 3 way water valve and up into front side of freezer cup section. This will "fill" icemaker for the freezing cycle- Check operation of spray bar drive motor thru left side service door.
5. Allow clock to carry unit through harvest cycle. This will be Approximately three minutes. Dial pointer should be set on Number 2 1/2. After the compressor starts, turn the dial completely around and send it through another harvest cycle. Do this several times. This will completely flush out machine of any dust that may have accumulated in shipment.
6. After machine has been properly flushed, allow it to go into a freezing cycle-check for possible water leaks, check sump pump operation - should be running freely. Also note if jet tube operation is correct, and that none of the jets are plugged.
7. Time clock dial does not rotate at the end of the harvest cycle; it is started later by the cube size thermostat control located in the control box.
8. Freezing time will be approximately 18 minutes in a 70 degree ambient. (Longer if above, and shorter if below.) Average complete cycle time is 20 minutes.
9. Watch first cube harvest and check to make sure that plastic curtain sections have not been damaged in shipment. Also that curtains do not swing back into freezer and catch on cube racks.
10. Check size of cubes made: If too small, after a second cycle, adjust cube size control to lower or colder setting - until desired cube size is reached.

INSTALLATION

11. Check texture of cubes made: Partially cloudy cubes throughout suggest unit running short of water near end of freezing, or possibly an extremely bad water condition, which would indicate use of filtering or purifying equipment. Contact SCOTSMAN - Queen Products, Div., Ice Machine Service Department, Albert Lea, Minnesota, for further details.
12. With unit on harvest cycle, take a handful of cubes made and hold on storage bin thermostat cover. Should cut unit off at end of harvest cycle. Remove ice, unit should cut back on automatically in 3 or 4 minutes. Thermostat is factory set at 35 degrees out, 39 degrees in.
13. Install gauges and check head and back pressure: air-cooled models, head pressure after twenty minutes of freezing cycle at 70° ambient will be approximately 125 pounds PSI. The back pressure starts out at approximately 50 pounds PSI and gradually pulls down to approximately 4 pounds PSI just before harvest cycle. Higher ambients and dirty condenser will cause higher pressures. Water-cooled models have water regulating valves factory set at 135 pounds PSI: check reading and adjust if necessary. Back pressure will operate the same as on air-cooled models.
14. Remove gauges, replace control box cover and all service panels.
15. Instruct owner on how to operate and clean machine.

HARVEST CYCLE

At the end of the freezing cycle the time clock operated switch opens compressor, sump pump and fan motor circuit, and closes circuit to time clock motor and solenoid operated inlet water valve. Inlet water pressure at bottom of hot water tank now forces heated water out the top of tank through warm water tubing and into front side of evaporator cup section. At the same time the surplus water from the preceding batch of ice cubes goes through three way water valve and off to drain. Water from the hot water tank flows into the rubber platen holding the evaporator cups and by conduction on back of cups causes the formed ice cubes to defrost or drop out. The platen-evaporator cavity is normally filled to the overflow level in 2 or 2 1/2 minutes. The amount of water running over the overflow pipe is controlled by the size of the flow control orifice and the length of the harvest time setting on the time clock past the overflow point. Overflow water goes down the drain also.

Meanwhile, cubes released drop by gravity to the inclined cube chute and thru the curtained opening into ice storage bin. At the completion of harvest cycle, the micro-switch on the timer now drops points holding defrost components in cycle and switches to freezing cycle set of contacts. Timer completes harvest cycle when microswitch arm lifts out of rear cam slot. Timer clock motor now stops and will not start again until cube size thermostat control closes once more. Electrically harvest cycle components cease, freezing cycle components start up. Chilled defrost water from the upper cavity now flows by gravity back through the three way water valve into freezer sump or reservoir pan. Here water is picked up by the water pump and continually recirculated through sprayer tube to produce the next batch of cubes.

HARVEST CYCLE MM110-J

FREEZING CYCLE

As the freezing cycle starts, electrically the components operating are the compressor and fan motor, recirculating water pump and the sprayer tube drive motor.

The refrigerant circuit which equalized at about 50 pounds gauge during the "off" or harvest cycle, thru the capillary refrigerant control, now rises rapidly to 125 - 135 pounds head pressure. The suction or low side pressure starting at 50 pounds pulls down fairly quickly to about 25 pounds at which point the ice cubes are starting to form a thin shell in cube cups. Continuing from 25 pounds slowly on down towards the finished cube pressure of approximately 5 pounds takes an average of 15-20 minutes.

During this portion of the freezing cycle the electrical brain is the reverse acting, cube size thermostat. This thermostat electrically is holding the freezing cycle components "live". When the ice cubes are about 3/4 formed, the decreasing suction pressure and temperature, activated the temperature sensing bulb of the reverse acting, cube size control, closing its contacts. This does not interrupt the freezing cycle, the closing of the cube size thermostat contacts electrically transfers the finishing of the freezing cycle to the finishing clock motor or timer as it is sometimes called. One full revolution of the timers dial is 15 minutes however of the total 15 minutes only, 3 minutes are used for the defrost or harvest cycle.

This means then that after the cube size contacts close they activate the timer motor. This control takes over and continues freezing cycle for another 12 minutes with timer dial now turning. When the 12 minutes are completed, an offset in the timer dial allows a micro switch with activating arm riding on that cam to drop into the slot electrically stopping the freezing cycle and starting the 3 minutes harvest cycle - The clock motor continues thru harvest cycles. A notch on the timer dial now lifts micro switch arm up on dial, electrically stopping harvest cycle and starts back into a new freezing cycle.

FREEZING CYCLE MM110-J

SERVICE ANALYSIS

SYMPTOM	POSSIBLE CAUSE	SUGGESTED CORRECTION
Unit will not run.	Blown fuse	Replace fuse & check for cause of blown fuse.
	Bin thermostat set too high	Adjust thermostat. Set between 35° out to 39 degrees in.
	Switch in Off position	Turn switch to On position.
	Inoperative master switch	Replace switch
	Timer contacts open	Replace timer micro-switch.
Compressor cycles intermittently	Low voltage	Check circuit for overloading. Check voltage at the supply to the building. If low, contact the power company.
	Dirty condenser	Clean with vacuum cleaner, air or stiff brush. (Do NOT use wire brush.)
	Air circulation blocked	Allow sufficient air space all around unit.
	Inoperative condenser fan motor	Check to see if defective. If defective, replace.
	Non-condensable gases in system	Purge the system.
Cubes too small	Cube size control set too high	Lower the setting. Turn towards colder.
	Partially restricted capillary tube.	Blow charge, add new gas & drier. After exacuating system with suction pump.
	Moisture in system	Same as above.
	Shortage of water	See remedies for shortage of water.
	Shortage of refrigerant	Check for leaks and recharge.
Cloudy cubes	Shortage of water	See remedies for shortage of water.
	Dirty water supply	Use water softener or water filter.
	Restricted drain on pump	Clean pump strainer.
	Accumulated impurities	Use SCOTSMAN Ice Machine Cleaner.
Poor harvests	Too short defrost time	Check and adjust harvest cycle. Timer should be set at 2 1/2.
	Restriction in incoming water	Check water feed line strainer and flow reducing valve. To give greater water flow increasing defrost time.
	Insufficient quantity of hot water	Cold ambient - must be 50° minimum faulty fan control on aircooled models.
	Solenoid valve not opening the water valve	Solenoid binding or burned out. Replace.
	Air vent holes in upper cube cups plugged	Clean out holes.

SERVICE ANALYSIS

SYMPTOM	POSSIBLE CAUSE	SUGGESTED CORRECTION
Shortage of water	Water spraying out through curtains	Replace broken curtains if any broken.
	Three-Way water valve leaking	Check the valve for foreign matter. Check valve seats and replace if necessary.
	Water entering hot water tank too slowly	Check pressure at source-20# required. Dirt in solenoid and flow control- blow out. Partial restrictions in water strainer. Clean Strainer.
Irregular size cubes and some cloudy	Some jets plugged	Clean jets.
	Shortage of water	See Shortage of Water
	Unit not level	Water overflowing air vent holes on low side burning cubes. Level as required.
Cubes too large	Cube size control turned too cold	Turn setting on cube size control dial towards warmer
Decreased ice capacity	Inefficient compressor	Replace.
	Leaky water valve	Replace or repair.
	High head pressure	Dirty condenser. Clean. Bad fan motor. Replace.
	Non-condensable gas in the system:	purge the system.
	Poor Air circulation or excessively hot location	relocate the unit, or provide for ventilation by cutting openings;
	Overcharge of refrigerant	Correct the charge. Purge off slowly.
Partially restricted cap tube	Purge & replace charge and drier	
Hole washed inside cube	Water over the top of the cube cups during harvest	Level unit.

By passes Thermostat
during freeze cycle.
- 18-699-3 Water cooled condenser W.C. models only
Packless #QVWC-37
3/4 H.P. rating - upright tank type
- 12-1532-1B Water recirculating, sump pump
Hartell Inc.
3000 RPM - shaded pole, thermally
protected motor - 1/25 H.P. 115/60/1
- 18-2201-1 Motor compressor 115/60/1
Copeland refrigeration - Copelaweld RSF-0050-1AA
2 Pole, 3500 RPM Hermetic for use with refrigerant
R-12
- A-21038-1 Finishing Clock or Timer
Manufactured by Queen Products Div.
2-1651 Knob cam assembly
12-1480 Micro switch.
- 12-1434-1 Water inlet solenoid
Detroit Controls Corp. #S-30-A
115/60/1 coil - Nylon body
1/4" MPT inlet & outlet No flow control.
Also American Standard Control #SSV-20206

SERVICE - COMPLETE UNIT

ALL STEPS LISTED BELOW SHOULD ONLY BE STARTED WHEN WATER AND ELECTRICAL SUPPLY ARE OFF TO PREVENT ACCIDENTS.

To remove cabinet top or hood.

1. Remove two back end screws in rear moulding strip.
2. Pull out black insert tape concealing screws.
3. Remove balance of screws in moulding strips.
4. Lift hood straight up.

To remove Sump Pump.

1. Remove left side service panel.
2. Disconnect hose clamps and hoses on pump ports.
3. Remove electrical lead to control box.
4. Remove 2 screws in pump mounting bracket.

To remove Agitator Motor on MM110

1. Remove left side service panel
2. Disconnect wires at the control box terminal board.
3. Loosen the Allen set screw on driver crank arm and remove the drive arm.
4. Remove the four hold-down screws and remove the motor.

To remove the jet tube assembly on Model MM110

1. Remove the plastic curtain assembly.
2. Remove the cube rack.
3. Lift the right end of the jet tube straight up and slide the other end out of the driving slot.

To remove Three Way Water Valve

1. Remove left side service door.
2. Remove all hose clamps to water valve.
3. Remove upper water line connection to elbow on top valve housing.
4. Loosen two nut and bolt assemblies holding valve to mounting bracket. Valve now drops free.
5. Replace in reverse of above.

To replace Storage Bin Door

1. Lift door up and slide back as you normally would to remove ice from bin.
2. Remove screw at center rear edge of door where it is attached to lanyard.
3. Pull door straight out.
4. Install repaired or new door in reverse of step number 2 above.

MAINTENANCE INSTRUCTION FOR SCOTSMAN SUPER CUBERS

THE FOLLOWING MAINTENANCE MUST BE ACCOMPLISHED TWO (2) TIMES PER YEAR ON ALL SCOTSMAN SUPER CUBERS. CALL YOUR AUTHORIZED SCOTSMAN SERVICE DEPARTMENT.

1. Clean air-cooled condenser; This is to be done frequently with the machine shut off.
2. Clean water system and evaporator, sump tank and screen, using Scotsman Ice Machine Cleaner or equivalent.
3. Remove jet tube and manually clean jets by unscrewing jets.
4. Check curtain assembly.
5. Tighten all electrical connections.
6. Tighten all bolts.
7. Check water supply. Check water pressure flow through flow control. Clean water strainer.
8. Oil jet tubes drive motor three(3) places. Use SAE 20 oil - 3 oil cups.
9. Oil Condenser fan motor. Punch sealed cap or remove screws where possible.
10. Check for refrigeration leaks with halide torch.
11. Check for water leaks. Tighten drain line connections.
12. Check size and condition of cubes. Adjust as required. See Service Analysis
13. Section.
Check bin thermostat setting. Factory set at 35° out, 39° in.

CLEANING INSTRUCTIONS FOR SCOTSMAN ICE MACHINES MODELS MM110J, SC100J and SM105J

1. Remove front access door.
2. Locate control box with time clock knob protruding through cover.
3. Start unit through a harvest cycle manually. This may be done by turning time clock knob clockwise until the snap of the timer microswitch is heard.
4. Let unit finish cube harvest cycle and start into freezing cycle. This will be approximately 5 minutes after Step #3 has been completed. At this time turn the compressor switch off, the lower of the two switches in the control box.
5. Locate the sump reservoir which is in the storage bin area and directly behind the ice discharge chute. This discharge chute is covered by a series of white plastic curtains which are free to swing out into the storage bin. Pour 4 ounces (half bottle) of "Scotsman Ice Machine Cleaner" into the sump reservoir.
6. Locate insulation panel which is directly above platen. Lift insulation panel, pour the remaining 4 ounces of "Scotsman Ice Machine Cleaner" into platen.
7. Let unit operate normally for 10 to 15 minutes into the freezing cycle. No ice will be made because the motor compressor is not in operation.
8. At the end of this time put the unit through 2 or 3 harvest cycles manually to allow fresh make up water to clean out remaining solution. Each time waiting approximately 5 minutes after the loud snap until the next harvest cycle is done manually.
9. Turn the compressor switch back on.
10. Check each new batch of cubes until they are clear and until acid taste has been removed from cubes.
11. Put hot water in storage bin to melt the cubes and thereby clean the drains with the same solution that has just cleaned the unit.
12. Use a damp cloth to wipe off curtains and inside of storage bin.
13. Replace all access doors.
14. Unit is now ready for continued automatic operation.

PARTS LIST MM110J

CABINET PARTS

		<u>S. S. Finish</u>
2-1736	Sliding Door Lanyard	
A-19238	Case hood assembly, less doors	A-19238-1
A-16208	Door slide track	
15-156	Emblem	
A-6509	Moulding strip - rear	
A-6510	Moulding strip - front	
A-15789	Cabinet front service	A-15789-2
A-16561	Cabinet right side service door	A-1656-2
A-16563	Cabinet rear service door	A-16563-2
2-1735	Sliding Door	A-15559
S-9405	Cabinet left side service door	S-9405-S

CONTROL BOX - ELECTRICAL COMPONENTS

12-813	Terminal Block
A-21038-1	Timer Assembly
12-1480	Timer Micro-switch
11-351	Cube size control
12-426-1	On-Off switches (2)
11-353	Bin thermostat
12-1645	Complete cube relay
11-352	Fan cycle control A.C.
11-357	H. Pressure control

CONDENSING UNITS AND REFRIGERANT CIRCUIT

	AIR-COOLED	WATER-COOLED
Freezer Cup and Platen only	A-16448	Same
Freezer and H X assembly complete	A-19039	Same
Drier - Refrigerant	2-350	Same
Motor compressor 115/60/1	18-2201-1	Same
Relay	18-2201-26	Same
Starting capacitor	18-2201-29	Same
Fan motor	18-1575-1	None
Fan blade	18-321	None
Condenser	18-334	18-699-3
Shroud for condenser	A-18229	
Klixon overload	18-2201-25	Same
Tire type valve cap	16-563	Same
Tire type valve core	16-560	Same
Rubber cube cup holder	S-9251	Same
Plastic curtain rod assembly	A-16465	Same
Water Regulating Valve	None	11-198

4. HOT WATER CONDENSER TANK

A-19026 Hot water tank complete - Air & Water cooled.

5. WATER VALVE

A-19722 Complete Valve
13-617-2 O-Ring
A-17937 Valve Cap Bottom
2-1545 Compression Spring
13-617-1 O-Ring
A-17942 Lower Plunger
3-1403-6 Cover Screws (6)
A-18192 Valve Cover
A-17941 Upper Plunger
13-606 Rubber Diaphragm
A-18312 Diaphragm Cover
A-17947 Valve Body

6. WATER CIRCUIT

12-1434-1 Inlet water solenoid
16-162 Inlet water strainer
A-19788-4 Inlet water flow control
12-1532-1B Sump pump assembly
A-16432 Sprayer tube assembly
2-1803-1 Sprayer tube jet only

7. DRIVE MOTOR AND LINKAGE

12-1346-1 Drive Motor
A-6726 Drive Linkage assembly
A-6462 Driver Arm Assembly
S-7132 Linkage Rod
S-7128 Driver Arm Assembly
S-8887 Drive Bearing Support
S-7639 Driving Journal

8. STORAGE BIN AND COMPONENTS

2-530 "O" Ring
A-18090 Storage Bin Drain Assembly, Male
A-6448 Drain, strainer
A-18102 Storage Bin Drain Ass'y, Female
A-19555 Bin Thermostat Bulb Cover
13-590 Bin Thermostat Bulb Gasket
A-16412 Cube Chute
A-16439 Curtain Assembly

9. MISCELLANEOUS

2-540 Ice Scoop
15-324 Plastic trim insert-per ft.
1-657 Packing crate
12-1532-51 Sump Pump motor only
19-343 Scotsman Ice Machine Cleaner
5-397-2 Nylon tube (per foot) 3/8"
5-379-1 Nylon tube (per foot) 1/4"
